### **NOTICE: Shelf Audit Results**

In the interest of public health, safety, and welfare, the Massachusetts Cannabis Control Commission (“Commission”) performed a shelf-audit of the below Marijuana or Marijuana Product to confirm the accuracy of the labeled Total THC. Consistent with the labeling requirements of 935 CMR 500.105(5) and 501.105(5), Licensees are required to affix information regarding the “full Cannabinoid Profile of the Marijuana contained within the package, including THC and other Cannabinoid levels” so that Consumers and Patients are informed of the cannabinoid content when making purchases. In determining whether the potency of a given Marijuana flower product is accurate, the Commission obtains a sample up to 1 ounce but in no instance less than 10 grams rounded to the nearest gram.

Verifying that Marijuana and Marijuana Products are accurately labeled is critical to the Commission’s mission of safely, equitably, and effectively enabling access to this industry as well as ensuring public health, safety, and welfare in accordance with G.L. cc. 94G and 94I. Please note, the Commission may also refer matters involving mislabeled Marijuana to the Attorney General’s Office’s Consumer Advocacy & Response Division, as needed.

### **WHY ARE YOU RECEIVING THIS NOTICE?**

On May 27, 2026, the Commission obtained a sample of product available for consumption by the public and submitted it as a blind sample to the same ITL that provided the initial testing results. The Commission directed the ITL to homogenize the sample and take three random sub-samples for testing.

### RESULTS OF THE COMMISSION'S AUDIT:

| Total THC <sup>1</sup> | THCa  | Δ9-THC | Audit #1<br>Total<br>THC | Audit #2<br>Total<br>THC | Audit #3<br>Total<br>THC | Audit Average<br>Total THC | %<br>Deviation<br>of Total<br>THC |
|------------------------|-------|--------|--------------------------|--------------------------|--------------------------|----------------------------|-----------------------------------|
| 26.98                  | 29.49 | 1.11   | 22.32                    | 22.16                    | 21.42                    | 21.97                      | -18.58                            |

The labeled potency of Marijuana flower is accurate if it falls within a range of  $\pm 25\%$  from the average result of the Commission's audit. See [Bulletin | Auditing of Labeled Potency | May 22, 2026](#). Any results outside of that range do not adequately inform the public about the product they are purchasing and are substantially non-compliant with Commission law.

To account for the natural variation present in Marijuana flower, the Commission averages the three results and applies the following calculation to determine the statistical deviation of the average from the reported potency:

$$\blacksquare \quad \% \text{ deviation} = \frac{\text{average observed potency} - \text{reported potency}}{\text{reported potency}} \times 100\%$$

On June 17, 2026, the Commission received results of the audit and have determined that the average result of Marijuana sampled deviates more than  $\pm 15\%$  from the labeled Total THC but less than  $\pm 25\%$ .

### WHAT ARE YOUR NEXT STEPS?

While the product is within expected values, the Commission recommends that the Licensee take steps to determine if the original sampling of the Marijuana batch was accurate, such as through a root cause analysis investigating representative sampling techniques or adherence to Written Operating Procedures. Refer to the *Protocol for the Sampling and Analysis of Finished Marijuana Products* sections 5.0 and 6.0 for compliance requirements and procedural guidance to ensure representative sampling appropriate for the applicable type of Marijuana.

If you have questions associated with this notice, please contact the Commission at [Enforcement@CCCMass.com](mailto:Enforcement@CCCMass.com).

Timothy Goodin, Enforcement Counsel  
Cannabis Control Commission

<sup>1</sup> In the event the referenced product did not have Total THC on the label, the Commission utilized the Δ9-THC and THCa on the label to determine to Total THC deviation.
